3.3	Description of additional info.	*CO <sub>2</sub> emission in the distribution sales area. *Electric power in the use and electric-power-consumption-ra *Print volume is assumed 375, *In this scenario, the CO <sub>2</sub> emission coole at 4.0g per A4 paper.	Calculated by the standard Scenario for MFP (EP type).  CO <sub>2</sub> emission in the distribution stage assumes the United States as the main sales area.  Electric power in the use and maintenance stage is evaluated with the public electric-power-consumption-rate in the United States.  Print volume is assumed 375,000 sheets.  In this scenario, the CO <sub>2</sub> emissions from copy papers are estimated 2,900 kg-CO <sub>2</sub> e at 4.0g per A4 paper.  The CO <sub>2</sub> emission of printing paper is excluded from the use and maintenance stage.  Disposal & recycling stage  4%  Production stage  1%  Use & maintenance stage	
3.4	Remarks			

4. Interpretation of CFP quantification results					
		CO2 emission in use and maintenance stage is the largest as 57%. It is important to save energy during product usage.			
4.1	Interpretation of CFP quantification results	The use condition in this scenario can be different from the use condition of the user.  A choice of the use condition (print mode, print conditions and so on) can reduce the CO2 emission during product usage.  For example, 175kg-CO2e of the CO2 emissions (approximately 14%) can be reduced if 2-in-1 print is applied to 187,500sheets (50% of print volume).  Primary data is used in the raw material consumption. Secondary data is used in the parts manufacturing process which might not be reflected our own circumstances because it is difficult to collect the data for thousands of the parts. Please understand this result as the rough estimate according to the reason mentioned above.
